OF LONDON**

CM3070 ZB

BSc EXAMINATION

COMPUTER SCIENCE

Final Project

Release date: Monday 16 March 2026 at 08:00 UK Time

Close date: Monday 16 March 2026 by 12:00 UK Time

Time allowed: 4 hours

INSTRUCTIONS TO CANDIDATES:

There are **FOUR** questions in the examination paper.

Question 1 is **COMPULSORY**. If you do not answer Question 1, **you will get a mark of zero for the entire examination.**

You should answer **ALL THREE** questions from Question 2 to Question 4. Each question carries 20 marks.

The marks for each part of a question are indicated at the end of the part in [.] brackets.

There are 60 marks available on this paper.

Calculators are **NOT** permitted in this examination.

~~You may use **ONE** A4 page of previously prepared notes in this examination. Please hold up your notes to the camera at the start of the examination.~~

File upload is **NOT** permitted in this examination.

**This is not allowed
from 2026**

Question 1

This question is **COMPULSORY**, though it carries no marks. If you do not answer this question, you will get a mark of zero for your entire exam.

- (a) What was the title of your project?
- (b) Which template was your project based on?
- (c) Briefly describe what your project was about.

Question 2

- (a) What is the main difference between the proposal for a project (whether as a video pitch or a written document) and the final report (again, whether considering the written document or the video aspect of this). Using your own project, give examples to illustrate this difference. Also comment on how your proposal related to your final report.

[5 marks]

- (b) The consideration of ethics is an important part of a design and development project. What are the most important ethical aspects to consider in software design and development? Which specific ethical considerations did you take into account in your project? Are there other ethical considerations you could or should have taken into account that you decided not to? Explain why.

[7 marks]

- (c) Explain the importance of doing background reading and a literature survey in a Computer Science project. Describe the most challenging aspect you faced when writing your literature survey, and how you overcame this.

[4 marks]

- (d) Discuss **ONE** ethical consideration in selecting and reporting background material, and explain your approach to addressing this consideration in your own project.

[4 marks]

Question 3

(a) Consider the following case study:

Imagine that your project is the development of a learning analytics algorithm to detect students at risk of failure.

Your evaluation consists of asking reviewers to take a set of inputs to the algorithm and their corresponding outputs, and answering the following sets of questions.

Set 1 consists of the following questions:

- *Does the output help me understand which students are at risk?*
- *Would this output help a teacher support students better?*
- *Would this output help you improve your WP student retention?*

Set 2 consists of the following questions:

- *Do you think student A is in need of additional support?*
- *Do you think student B is in need of additional support?*
- *Do you think student C is in need of additional support?*

Critically discuss the tasks presented, and the questions asked, in the context of the evaluation approach that is being taken. Include suggestions for additional or different approaches to the evaluation.

[10 marks]

(b) Imagine you are required to give an in-person presentation, of 20 minutes, to discuss the most significant aspects of your project. Outline, with concrete detail, what this presentation would consist of, and which parts of the project you would highlight. Justify your choices of what you would include. Also comment on what aspects would be most challenging to present.

[6 marks]

(c) Based on the significant aspects of your project identified in part (b) of this question, suggest further work – with justification of why – that another student might do, to continue or further advance the outcome in some way. Be as explicit as possible.

[4 marks]

Question 4

- (a) Explain what makes a project a Computer Science project rather than an IT deployment. Discuss, with justification, where your project fits within this range, and what implications this has for future work on the same project. [4 marks]
- (b) In terms of inclusive design, explain the core similarities and differences between the radical inclusion approach and the born-accessible approach to inclusive software design. Include examples to illustrate the distinctions. [4 marks]
- (c) Identify **ONE** significant theoretical construct used in your project and explain its role in the project. Discuss why the construct was significant, and whether it was the best or the only option you could have chosen. If it was the best or only option, describe why this was the case; and if it wasn't, then discuss what other options were available and why you did not choose them. [5 marks]
- (d) Describe **ONE** algorithm or method you used in the app, program, or system that you designed and developed, and explain your choice process, justifying the decisions you made about using that algorithm or method. [3 marks]
- (e) Reproducibility refers to the extent to which an algorithm, method, or tool can produce the same result when used again under the same, or similar, conditions. Discuss how this concept applies to the algorithm or method you described in Part (d) above. [4 marks]
